# Software Quality Assurance (WS 10/11)

Problem Set 4 Due Wednesday, December 15<sup>th</sup>, 2010

### **Problem 1: Functional Test: Equivalence Class Partitioning**

A booking system processes incoming payment and payout of business customers and private customers according to transaction principles. For this processing, the system requires the account number as well as **the amount posted**. A **payout** is valid if it does not exceed the limit of the maximum amount of 5000. A business account number begins with a B. A private account number begins with a P.

- a) Please determine the equivalence class partitions for the given functionalities.
- b) Please determine the test cases for all the equivalence classes.

#### Problem 1 (Variant 2)

A booking system processes incoming payment and payout of business customers and private customers according to transaction principles. For this processing, the system requires the account number as well as **the booking amount**. A **booking** is valid if it does not exceed the limit of the maximum amount of  $5000 \in$ . A business account number begins with a B. A private account number begins with a P.

- a) Please determine the equivalence class partitions for the given functionalities.
- b) Please determine the test cases for all the equivalence classes.

# Problem 2: Equivalence Class Partitioning with Boundary Value Analysis

A student data management program processes registration number, name, major, and mark (on average) of every single student. The student registration number is a five-digit integer that is not smaller than 10000. The program knows the majors Mathematics, Computer Science, Philosophy, and English. The program knows the marks 1.0, 2.0, 3.0, 4.0, and 5.0. A valid name has at least 3 and at most 20 characters.

- a) Please determine the equivalence class partitions for the given functionalities.
- b) Please determine the test cases for all the equivalence classes using the procedure of boundary value analysis.

## **Problem 3: State-based Test**

Given is the specification of a digital watch software.

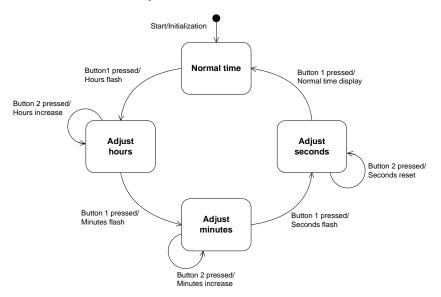

For adjustment of a digital watch, the following states are to be considered: *Normal time:* State after inserting the battery *Adjust Hours:* Hours can be adjusted *Adjust Minutes:* Minutes can be adjusted *Adjust Seconds:* Seconds can be adjusted

The following events could occur: Start signal: Battery inserted Button 1 pressed Button 2 pressed The two buttons must not be pressed simultaneously.

The following outputs could happen:

Hours flash:	The operator is currently in the hour editing mode.
Minutes flash:	The operator is currently in the minute editing mode.
Seconds flash:	The operator is currently in the second editing mode.
Hours increase:	The hour display has increased by 1 hour.
Minutes increase:	The minutes display increases by 1 minute.
Seconds reset:	00 displays as second display.
Initialization:	Display of 00:00:00

State chart "Watch adjustment"

- a) Please determine the test data for the program execution that traverses every state. Please select the simplest test cases.
- b) Please determine the test data for the program execution that traverses every transition. Please select the simplest test cases.
